DOUBLE CHANNEL HIGH SIDE SOLID STATE RELAY

Table 1. General Features

Type	R _{DS(on)}	I _{OUT}	V _{CC}
VND920-E	16mΩ	35 A (*)	36 V

(*) Per channel with all the output pins connected to the PCB.

- CMOS COMPATIBLE INPUT
- PROPORTIONAL LOAD CURRENT SENSE
- SHORTED LOAD PROTECTION
- UNDERVOLTAGE AND OVERVOLTAGE SHUTDOWN
- OVERVOLTAGE CLAMP
- THERMAL SHUTDOWN
- CURRENT LIMITATION
- PROTECTION AGAINST LOSS OF GROUND AND LOSS OF V_{CC}
- VERY LOW STAND-BY POWER DISSIPATION
- REVERSE BATTERY PROTECTION (**)
- IN COMPLIANCE WITH THE 2002/95/EC EUROPEAN DIRECTIVE

DESCRIPTION

The VND920-E is a double chip device made by using STMicroelectronics VIPower M0-3 Technology, intended for driving any kind of load with one side connected to ground. Active V_{CC} pin voltage clamp protects the device against low energy spikes (see ISO7637 transient compatibility table).

Table 2. Order Codes

Package	Tube	Tape and Reel
PowerSO-10™	VND920-E	VND920TR-E

Note: (**) See application schematic at page 9.

Figure 1. Package

Active current limitation combined with thermal shutdown and automatic restart protect the device against overload. Built-in analog current sense output delivers a current proportional to the load current. Device automatically turns off in case of ground pin disconnection.

Note: 2. V_{clamp} and V_{Ov} are correlated. Typical difference is 5V.

ELECTRICAL CHARACTERISTICS (continued)

Table 7. Switching ($V_{CC} = 13V$)

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
$t_{d(on)}$	Turn-on Delay Time	$R_L = 1.3\Omega$ (see figure 2)		50		μs
$t_{d(off)}$	Turn-off Delay Time	$R_L = 1.3\Omega$ (see figure 2)		50		μs
$dV_{OUT}/dt_{(on)}$	Turn-on Voltage Slope	$R_L = 1.3\Omega$ (see figure 2)		See relative diagram		$V/\mu s$
$dV_{OUT}/dt_{(off)}$	Turn-off Voltage Slope	$R_L = 1.3\Omega$ (see figure 2)		See relative diagram		$V/\mu s$

Table 8. Logic Input

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
V_{IL}	Input Low Level				1.25	V
I_{IL}	Low Level Input Current	$V_{IN} = 1.25V$	1			μA
V_{IH}	Input High Level		3.25			V
I_{IH}	High Level Input Current	$V_{IN} = 3.25V$			10	μA
$V_{I(hyst)}$	Input Hysteresis Voltage		0.5			V

Table 9. V_{CC} - Output Diode

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
V_F	Forward on Voltage	$-I_{OUT} = 5A$; $T_j = 150^\circ C$			0.6	V

Table 10. Protections (see note 3)

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
T_{TSD}	Shut-down Temperature		150	175	200	$^\circ C$
T_R	Reset Temperature		135			$^\circ C$
T_{hyst}	Thermal Hysteresis		7	15		$^\circ C$
I_{lim}	DC Short Circuit Current	$V_{CC} = 13V$ $5V < V_{CC} < 36V$	30	45	75	A
V_{demag}	Turn-off Output Clamp Voltage	$I_{OUT} = 2A$; $V_{IN} = 0V$; $L = 6mH$	$V_{CC} - 41$	$V_{CC} - 48$	$V_{CC} - 55$	V
V_{ON}	Output Voltage Drop Limitation	$I_{OUT} = 1A$; $T_j = -40^\circ C \dots +150^\circ C$		50		mV

Note: 3. To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

ELECTRICAL CHARACTERISTICS (continued)

C	All functions of the device are performed as designed after exposure to disturbance.
E	One or more functions of the device is not performed as designed after exposure to disturbance and cannot be returned to proper operation without replacing the device.

Figure 6. Waveforms

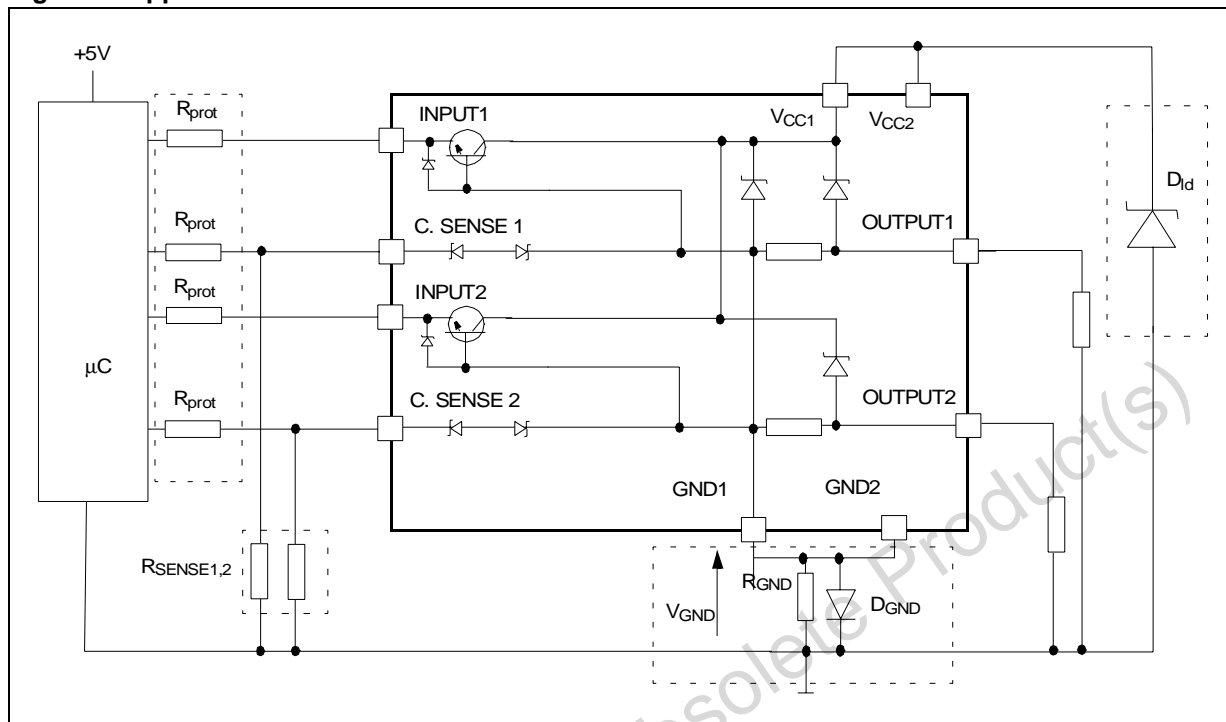

Figure 7. Application Schematic

GND PROTECTION NETWORK AGAINST REVERSE BATTERY

Solution 1: Resistor in the ground line (R_{GND} only). This can be used with any type of load.

The following is an indication on how to dimension the R_{GND} resistor.

- 1) $R_{GND} \leq 600mV / (I_{S(on)max})$.
- 2) $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where -I_{GND} is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device's datasheet.

Power Dissipation in R_{GND} (when V_{CC}<0: during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSD. Please note that the value of this resistor should be calculated with formula (1) where I_{S(on)max} becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not common with the device ground then the R_{GND} will produce a shift (I_{S(on)max} * R_{GND}) in the input thresholds and the status output values. This shift will vary depending on how many devices are ON in the case of several high side drivers sharing the same R_{GND}.

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then the ST suggests to utilize Solution 2 (see below).

Solution 2: A diode (D_{GND}) in the ground line.

A resistor (R_{GND}=1kΩ) should be inserted in parallel to D_{GND} if the device will be driving an inductive load.

This small signal diode can be safely shared amongst several different HSD. Also in this case, the presence of the ground network will produce a shift (j600mV) in the input threshold and the status output values if the microprocessor ground is not common with the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

LOAD DUMP PROTECTION

D_{ld} is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds V_{CC} max DC rating. The same applies if the device will be subject to transients on the V_{CC} line that are greater than the ones shown in the ISO T/R 7637/1 table.

Series resistor in INPUT and STATUS lines are also required to prevent that, during battery voltage transient, the current exceeds the Absolute Maximum Rating.

Safest configuration for unused INPUT and STATUS pin is to leave them unconnected.

µC I/Os PROTECTION:

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line to prevent the µC I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of µC and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of µC I/Os.

$$-V_{CCpeak} / I_{latchup} \leq R_{prot} \leq (V_{OHµC} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For V_{CCpeak}= -100V and I_{latchup} ≥ 20mA; V_{OHµC} ≥ 4.5V
 $5k\Omega \leq R_{prot} \leq 65k\Omega$.

Recommended R_{prot} value is 10kΩ.

Figure 19. I_{LIM} Vs T_{case}

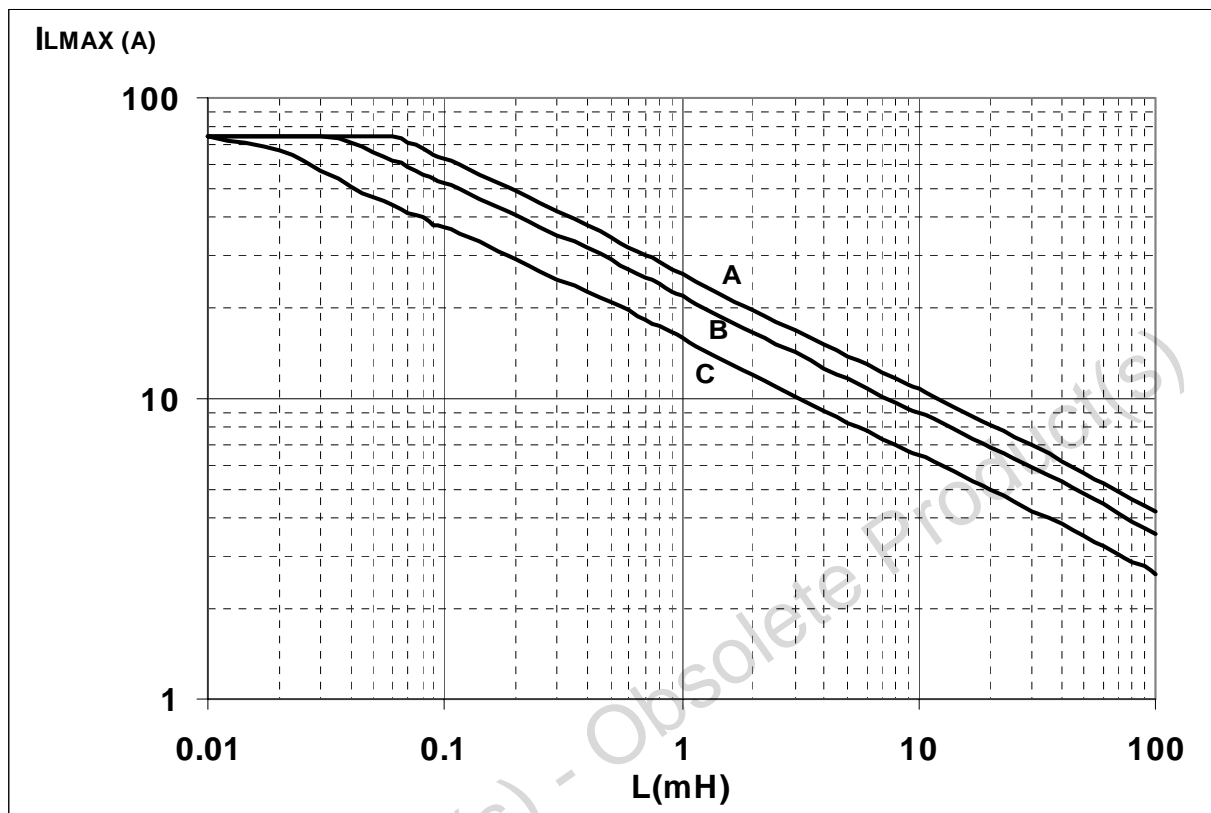

Figure 20. Maximum turn off current versus load inductance

- A = Single Pulse at $T_{Jstart}=150^{\circ}C$
- B= Repetitive pulse at $T_{Jstart}=100^{\circ}C$
- C= Repetitive Pulse at $T_{Jstart}=125^{\circ}C$

Values are generated with $R_L=0\Omega$

In case of repetitive pulses, T_{Jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves B and C.

Conditions:

$V_{CC}=13.5V$
